Abstract

In the context of High Energy Physics computing field the R&D studies aimed to the definition of the data and workload models have been carried on and completed by the SuperB community beyond the experiment life itself. The work resulted of great interest for ageneric mid- and small size VO to fulfill Grid exploiting requirements involving CPU-intensive tasks. We present the R&D line achievements in the design, developments and test of a distributed resource exploitation suite based on DIRAC. The main components of such a suite are the information system, the job wrapper and the new generation DIRAC framework. The DB schema and the SQL logic have been designed to be able to be adaptive with respect to the VO requirements in terms of physics application, job environment and bookkeeping parameters. A deep and flexible integration with DIRAC features has been obtained using SQLAlchemy technology allowing mapping and interaction with the information system. A new DIRAC extension has been developed to include this functionality along with a new set of DIRAC portal interfaces aimed to the job, distributed resources, and metadata management. The results of the first functionality and efficiency tests will be reported.

Information System – SBK database

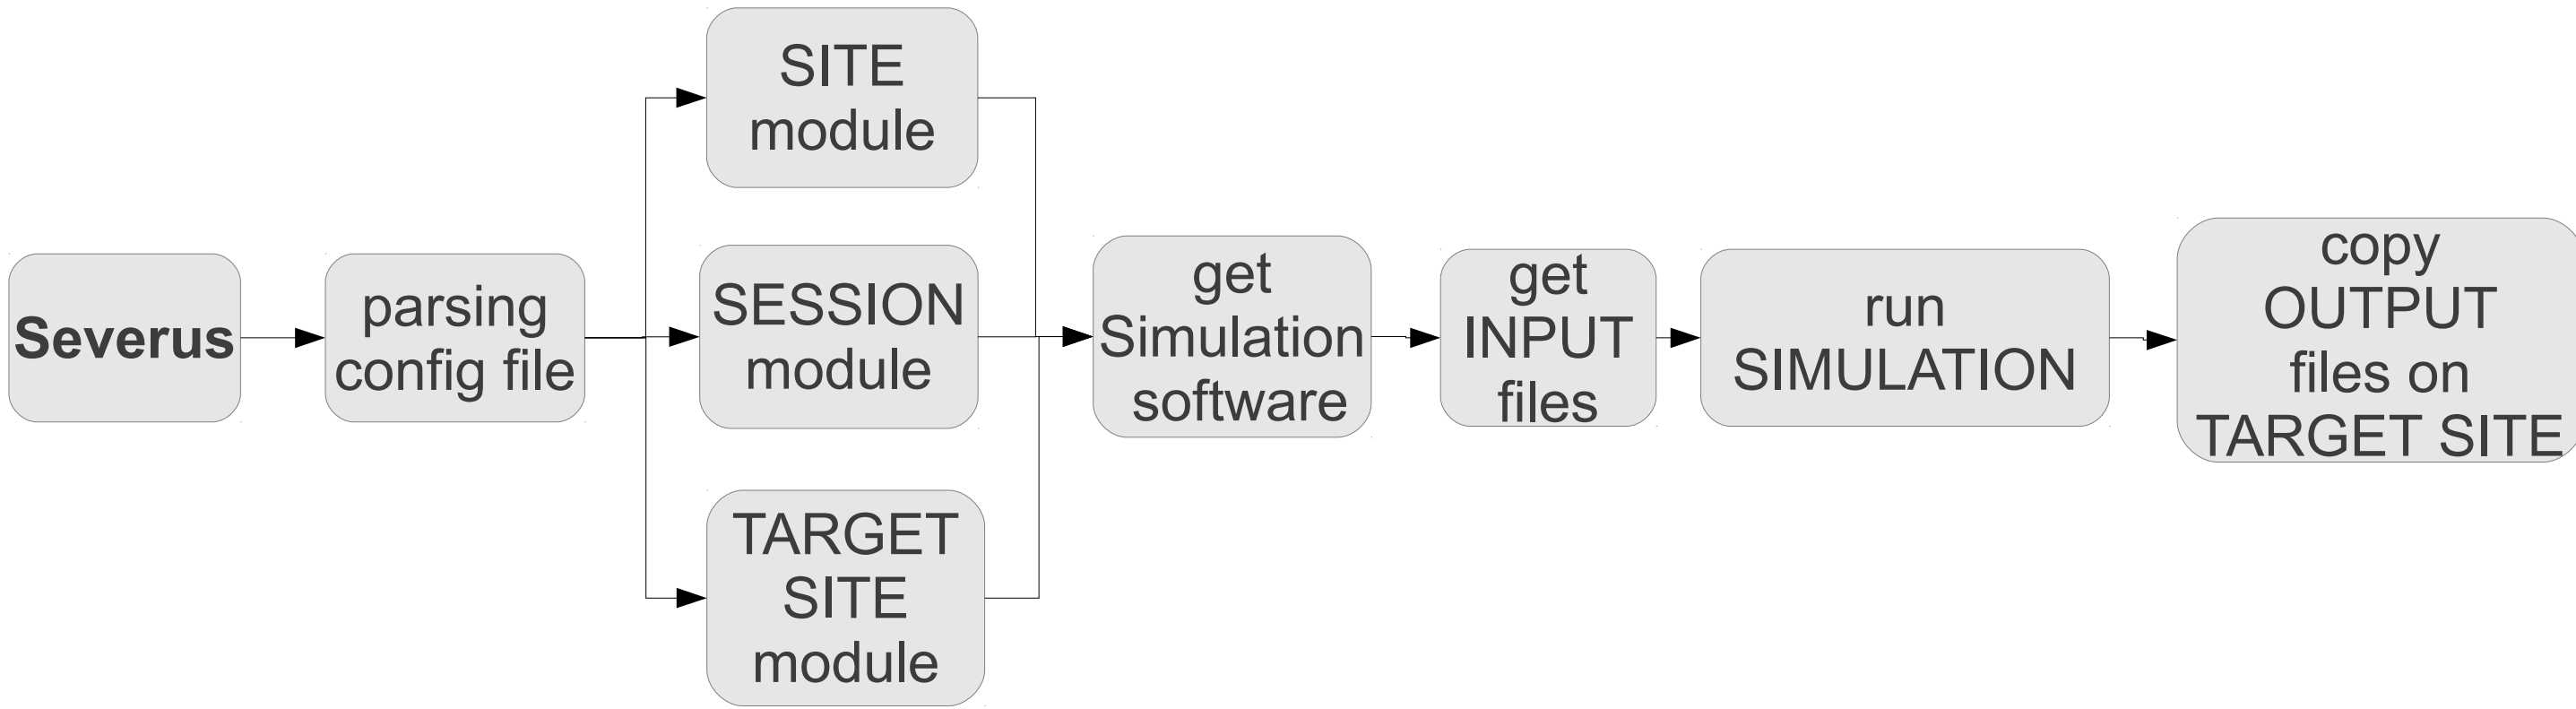

- relies on PostgreSQL 9.1
- exploits hstore fields, trigger and PL/pgSQL language
- normalized structure: NF1, NF2 and NF3 compliant
- capable to sustain high transaction load (900 operations/sec)

SBK entities

- **Session:** defines a simulation
 - parameters and software
- **Production:** Session subset to produce all needed to simulate a scenario (eg. Background in detector)
- **Request:** Production subset – set required events to simulate
- **Submission:** final step is job submission
 - Schedule
 - re-submission
 - monitoring

Severus Job Wrapper

Configuration file define:

- OPTIONS
- SOFTWARE
- REST
- SITE
- TARGET SITE
- INPUT
- OUTPUT
- EXPORT VARS
- SESSION NAME

SuperB DIRAC

- DIRAC extension
- SQLALchemy layer
- Integration with Information System
- Severus compatible
- DIRAC webportal extension
- Site monitoring
- Simulation job monitoring
